

SPACE JUMPER

2 ZERO HUNGER

By 2023, nearly 1 in 11 people worldwide faced hunger while more than 2 billion experienced moderate to severe food insecurity.

What World Do You Want in 2030?

WHAT
We offer fresh and nutritious foods, such as fruits, vegetables, and fish, cultivated through aquaponics and aquaculture. We develop aquaponics and aquaculture facilities to promote self-sufficiency and food security. Our approach not only combats hunger but also boosts the local economy, protects the environment, and fosters sustainability in agriculture

HOW
We use the combination of aquaculture and aquaponics to sustainably and efficiently cultivate fish and plants, directly contributing to SDG 2 - Zero Hunger. We produce nutritious food by supporting the eradication of hunger through advanced technologies and sustainable practices.

WHY
We promote the connection between human technology and nature. We believe in the transformative power of collaboration between humans and the natural world to create a more prosperous and harmonious future where food security is guaranteed

Return with the Elixir

The Space Jumpers, a group of space explorers, receive a whisper from the moon of a distant planet that awakens in them the desire to do something great: find ways to relieve suffering and eradicate hunger on Earth. They leave their safety and set out in search of a purpose that transcends scientific curiosity — a mission of service and solidarity.

The Sage of the Galaxies, an ancient entity, teaches them wisdom about universal harmony, ecological balance, and the right to well-being for all forms of life. Under its guidance they gain not only technical knowledge but also an ethical compass that directs their decisions: respect natural cycles, prioritize justice, and design sustainable solutions.

They arrive on Earth to find plenty of resources yet widespread hunger and inequality; despite technical, social, and institutional obstacles, they learn from failures, gain local allies, and create a regenerative system that integrates fish rearing and plant cultivation.

With that practical, collaborative knowledge, they founded Aquoponic Fruit Company, an initiative that sustainably produces nutritious food and shares technology and education with communities in need. The "elixir" they provide is not only food, but also knowledge, models of cooperation, and a connection with nature
